

Package ‘FMIndex’

August 28, 2023

Title A package for computing FM index

Version 0.99.0

Description The package computes the FM index of a DNA string contained in a fasta file.
The user can specify the path where he wants to save the FM index data structures.
The results will be also printed on the console.

Imports Biostrings, utils

Suggests knitr, rmarkdown, BiocStyle, testthat

License GPL-2

Encoding UTF-8

Roxygen list(markdown = TRUE)

RoxygenNote 7.2.3

VignetteBuilder knitr

biocViews Normalization, Preprocessing

Depends R (>= 3.6)

NeedsCompilation no

FMIndex-package	<i>FMIndex - Computer the FM index for a DNA sequence contained in a fasta file The FMIndex package implements all the functions necessary to compute the data structures of the FM index</i>
-----------------	---

Description

Package: FMIndex
 Type: Package
 Date: 2023-06-20
 License: GPL (>=2)

Author(s)

FMIndex	<i>Writes the FM index</i>
---------	----------------------------

Description

This function writes the FM index of the DNA sequence contained in the .fasta file given in input

Usage

```
FMIndex(fastafilename, uspath, tallywidth = 1, includeEndChar = TRUE)
```

Arguments

fastafilename	The .fasta file containing one single DNA sequence, files containing multiple sequences are not allowed
usrpath	The directory path where the user wants to save the files: it must end with '/' (you can leave it empty if you want to save the files in your working directory).
tallywidth	How you want to compress the tally table. Default value=1
includeEndChar	default value: true

Details

This function may raise an error if: - The FASTA file provided contains more than one sequence
- The FASTA file provided contains no sequences - The sequence of the FASTA file provided is empty

Value

A list containing all the data structures necessary for the FM index

Examples

```
FMIndex(system.file("extdata/examples/seq.fasta", package="FMIndex"), "")  
FMIndex(system.file(  
  "extdata/examples/seq.fasta", package="FMIndex"), "", tallywidth=1)
```

getBWTcharacter	<i>Compute the i-th character of the BWT</i>
-----------------	--

Description

This function computes the i-th character of the BWT of a given sequence which corresponds to the i-th character in the L column.

Usage

```
getBWTcharacter(index, sequence, suffixarray)
```

Arguments

index	The position which you want to find the character
sequence	The string you want to know the i-th L column character
suffixarray	An integer vector containing the suffix array of the input string

Value

A character containing the i-th character of the input sequence

getFcolumn	<i>Compute the F column</i>
------------	-----------------------------

Description

This function gets a DNASTring and gives the F column of the FM index

Usage

```
getFcolumn(seq, includeEndChar = TRUE)
```

Arguments

seq	the DNASTring to be analysed
includeEndChar	True if you want to include the ".", false if you want to exclude it. Default value:TRUE

Value

An integer vector with all the frequencies in the dna sequence given in input

Examples

```
getFcolumn(Biostrings::DNASTring("ACCT"))
```

getLcolumn	<i>Compute the L column of a sequence</i>
------------	---

Description

This function gets a character and gives the F column of the FM index

Usage

```
getLcolumn(sequence)
```

Arguments

sequence	the DNASTring to be analysed
----------	------------------------------

Value

A DNASTring containing the L column of the FM index

Examples

```
getLcolumn(Biostrings::DNASTring("ACGT"))  
getLcolumn(Biostrings::DNASTring("AACCGT"))
```

`getSA`*Compute the suffix array of a string*

Description

This function computes the suffix array of a given string

Usage

```
getSA(sequence)
```

Arguments

sequence a DNASTring representing the string sequence

Value

An integer array containing the suffix array

Examples

```
getSA(Biostrings::DNASTring("ACGT"))  
getSA(Biostrings::DNASTring("AACCGT"))
```

`getSuffix`*Get the suffix*

Description

This function gets the suffix of the string starting from a position given in input

Usage

```
getSuffix(index, sequence)
```

Arguments

index An integer representing the starting position of the string
sequence The sequence you want to find the suffix

Value

The substring starting at the given position

getTallyTable	<i>Create the Tally Table</i>
---------------	-------------------------------

Description

Creates the Tally Table of a given BWT of a string

Usage

```
getTallyTable(l.col, rowwidth = 1)
```

Arguments

l.col	A DNASTring containing the L column of the FM index
rowwidth	Step for saving rows of the tally table. The default value is 1 which corresponds to save all the rows of the tally table

Value

The tally table of the input sequence

Examples

```
getTallyTable(Biostrings::DNASTring("T.AACCG"))
getTallyTable(Biostrings::DNASTring("T.AACCG"), 2)
```

getTallyTableLine	<i>Create the i-th row of the Tally Table</i>
-------------------	---

Description

This function creates the i-th row of the Tally Table

Usage

```
getTallyTableLine(index, l.col, alphabet)
```

Arguments

index	An integer representing the index of the i-th row you want to build
l.col	A DNASTring object containing the L column of the FM index
alphabet	A character vector containing the alphabet to consider in counting the elements

Value

the i-th row of the Tally Table
