Package 'FMIndex'

August 24, 2023

Title A package for computing FM index
Version 0.99.0
Description The package computes the FM index of a DNA string contained in a fasta file. The user can specify the path where he wants to save the FM index data structures. The results will be also printed on the console.
Imports Biostrings, utils
Suggests knitr, rmarkdown, BiocStyle, testthat
License GPL-2
Encoding UTF-8
Roxygen list(markdown = TRUE)
RoxygenNote 7.2.3
VignetteBuilder knitr
biocViews Normalization, Preprocessing
Depends R (>= 2.10)
NeedsCompilation no

FMIndex-package

FMIndex - Computer the FM index for a DNA sequence contained in a fasta file The FMIndex package implements all the functions necessary to compute the data structures of the FM index

Description

Package: FMIndex Type: Package Date: 2023-06-20 License: GPL (>=2)

Author(s)

Sara Resta [aut, cre] Politecnico di Milano Maintainer: Sara Resta

E-mail: sara.resta@mail.polimi.it

FMindex

Writes the FM index

Description

This function writes the FM index of the DNA sequence contained in the .fasta file given in input

Usage

FMindex(fastafile, usrpath, tallywidth = 1, includeTerminationCharacter = TRUE)

getBWTcharacter 3

Arguments

fastafile The .fasta file containing one single DNA sequence, files containing multiple

sequences are not allowed

usrpath The directory path where the user wants to save the files: it must end with '/'

(you can leave it empty if you want to save the files in your working directory).

tallywidth How you want to compress the tally table. Default value=1

include Termination Character

default value: true

Value

A list containint all the data structures necessary for the FM index

Examples

```
FMindex(system.file("extdata/examples/seq5.fasta",package="FMIndex"),"")
FMindex(system.file("extdata/examples/seq5.fasta",package="FMIndex"),"",tallywidth=1)
```

getBWTcharacter

Compute the i-th character of the BWT

Description

This function computes the i-th character of the BWT of a given sequence which corresponds to the i-th character in the L column.

Usage

```
getBWTcharacter(index, sequence, suffixarray)
```

Arguments

index The position which you want to find the character

sequence The string you want to know the i-th L column character

suffixarray An integer vector containing the suffix array of the input string

Value

A character containing the i-th character of the input sequence

4 getLcolumn

getFcolumn

Compute the F column

Description

This function gets a DNAString and gives the F column of the FM index

Usage

```
getFcolumn(seq, includeTerminationCharacter = TRUE)
```

Arguments

seq the DNAString to be analysed

include Termination Character

True if you want to include the ".", false if you want to exclude it. Default

value:TRUE

Value

An integer vector with all the frequences in the dna sequence given in input

Examples

```
getFcolumn(Biostrings::DNAString("ACCT"))
```

getLcolumn

Compute the L column of a sequence

Description

This function gets a character and gives the F column of the FM index

Usage

```
getLcolumn(sequence)
```

Arguments

sequence

the string to be analysed

Value

A DNAString containing the L column of the FM index

getSuffix 5

Examples

```
getLcolumn(Biostrings::DNAString("ACGT"))
getLcolumn(Biostrings::DNAString("AACCGT"))
```

getSuffix

Get the suffix

Description

This function gets the suffix of the string starting from a position given in input

Usage

```
getSuffix(index, sequence)
```

Arguments

index An integer representing the starting position of the string

sequence The sequence you want to find the suffix

Value

The substring starting at the given position

getTallyTable

Create the Tally Table

Description

Creates the Tally Table of a given BWT of a string

Usage

```
getTallyTable(1.col, rowwidth = 1)
```

Arguments

1. col A DNAString containing the L column of the FM index

rowwidth Step for saving rows of the tally table. The default value is 1 which corresponds

to save all the rows of the tally table

Value

The tally table of the input sequence

6 getTallyTableLine

Examples

```
getTallyTable(Biostrings::DNAString("T.AACCG"))
getTallyTable(Biostrings::DNAString("T.AACCG"),2)
```

getTallyTableLine

Create the i-th row of the Tally Table

Description

This function creates the i-th row of the Tally Table

Usage

```
getTallyTableLine(index, 1.col, alphabet)
```

Arguments

index An integer representing the index of the i-th row you want to build 1.col A DNAString object containing the L column of the FM index

alphabet A character vector containing the alphabet to consider in counting the elements

Value

the i-th row of the Tally Table
